

AI is already in your pocket.

It is just only ever in one pocket at a time.

TODAY

Your AI and your colleague's have never met.

- Two people, two phones, two separate assistants.
- You screenshot one and paste it into the other.
- Whatever you agreed never reaches either of them.

ILLUSTRATION

Two phones side by side, each with its own AI chat, and a screenshot being forwarded from one to the other. Buildable without a shoot.

Put everyone's pocket in the same room.

- One conversation, shared across everybody's phone.
- In the messaging app they already have open.
- An agent in the middle, sorting out who wants what.

ILLUSTRATION

THE money shot. The 4-up frame mid-conflict: Julie's phone, Tom's phone, the room view showing the agent's "Tom's villa is 16k, Julie's cap is 12k", and the artifact.

GETTING IN

Text a bot. You are in.

- No app to download. No account to create. No login to share.
- Send someone the code and their phone is in the room too.
- An agent joins exactly the same way a person does.

ILLUSTRATION

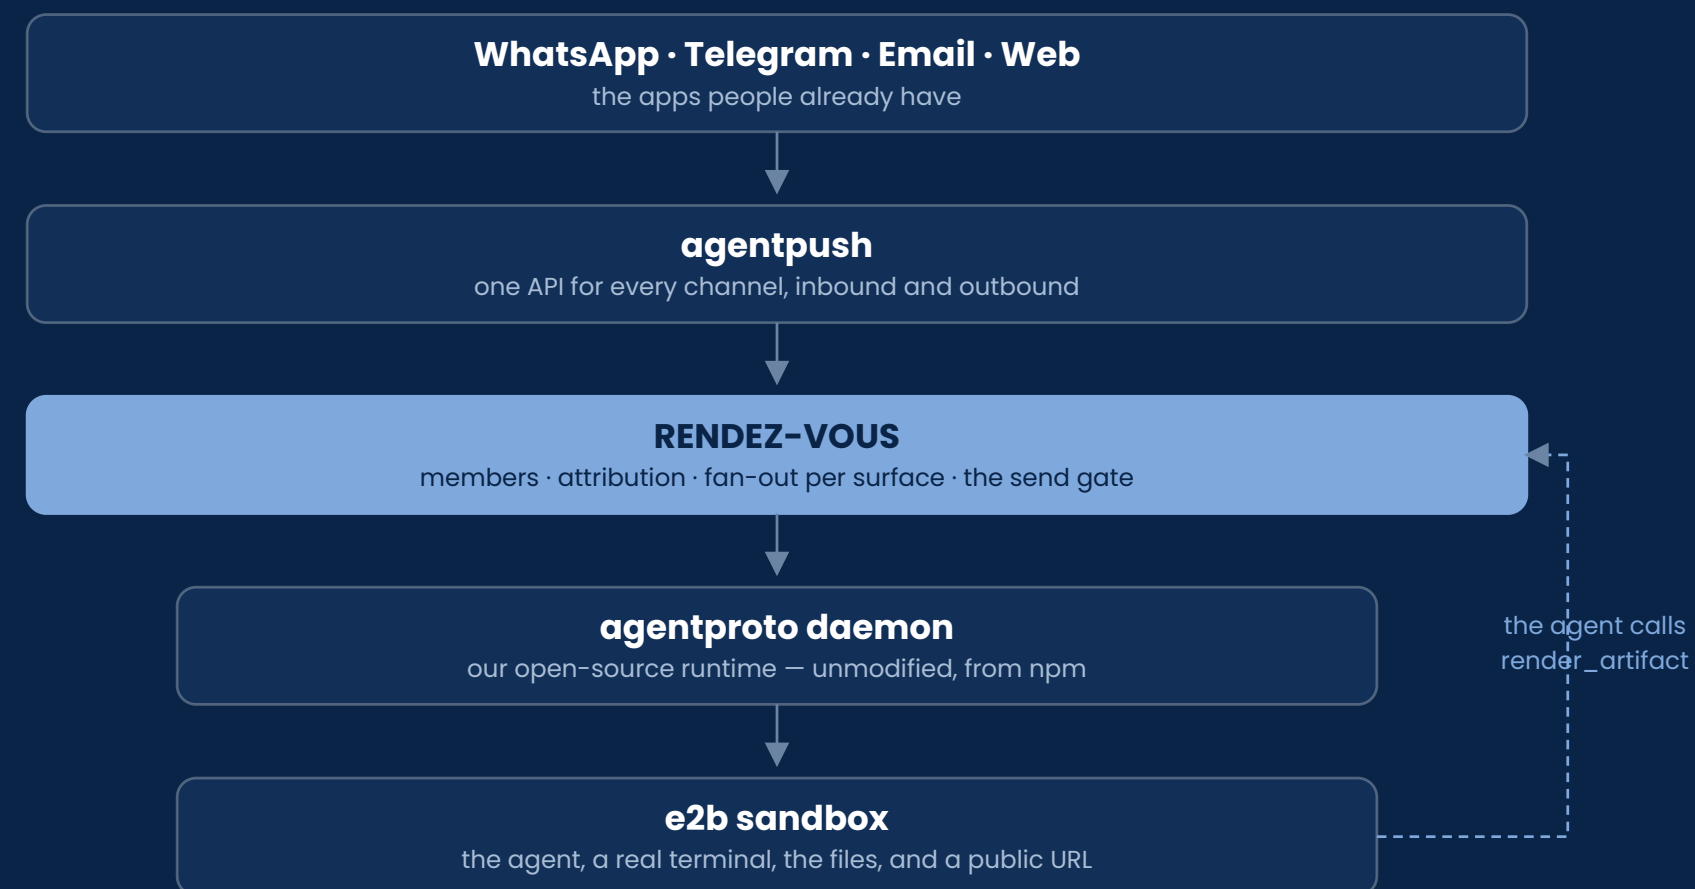

One phone: “new” → the room code and QR come straight back. A second phone joins. Two real screens.

One orchestrator. N humans. N agents.

Only the orchestrator sees every thread — which is how it can tell you that what you just asked for contradicts what someone else asked for.

What it runs on.

The sandbox is the isolation boundary: nobody's laptop, and no member's credentials inside it. The room reaches the agent through the daemon; the agent reaches back out through one MCP tool, and only that one.

**One room, in everyone's
pocket.**

You are not the middleman anymore.

On a real phone, not a mock.

- Texted “new” from a phone — a working room, with a shared document, in 86 seconds.
- Two people on two surfaces: every message attributed, one answer reaching both.
- Voice notes and photos in; a voice note, a PDF and a live website back out.
- A private answer to one member — the others see that it happened, not what it said.
- We deleted the machine out from under the room; the next message brought it back.
