

Work is multiplayer.

Agents are single-player.

TODAY

You spend your day copy-pasting between two chats.

- One thread per person. One chat per AI.
- You carry the context between them, by hand.
- Nobody else ever sees it.

ILLUSTRATION

Two chat windows side by side, the same message being dragged from one to the other. Build this one — no shoot needed.

RENDEZ-VOUS

Everyone works in one room — people and agents.

- Several people. Several agents. One conversation.
- Each on the app they already use.
- An agent in the middle, sorting out who wants what.

ILLUSTRATION

THE money shot. The 4-up frame mid-conflict: Julie's phone, Tom's phone, the room view showing the agent's "Tom's villa is 16k, Julie's cap is 12k", and the artifact.

GETTING IN

You join by texting a bot.

- Nothing to install. No account to share.
- Phone, browser, or just reply to the email.
- An agent joins the same way a person does.

ILLUSTRATION

One phone: “new” → the room code and QR come straight back. A second phone joins. Two real screens.

HOW IT ACTUALLY WORKS

From a text message to something everyone can open.

- 1** You send a message — WhatsApp, Telegram, or an email reply. Nothing to install.
- 2** It lands in the room with your name on it, so everyone sees who said what.
- 3** One agent reads everything everyone has said — not just your side of it.
- 4** It works on a real computer in the cloud: it writes the files, builds the document, puts the site online.
- 5** **NOTHING LEAVES WITHOUT A YES**
It shows you what it is about to send and to whom, and waits for one of you to confirm.

Everyone gets the reply on their own app, and the same link to the same document. Change it, and it changes for everyone.

Built on agentpush for the messaging, our open-source agentproto runtime for the agent, and an e2b sandbox for the machine.

ILLUSTRATION

The live site open in a browser with the URL visible, next to the finished PDF on a phone.

You are not the middleman anymore.

Humans and agents, finally in the same room.

Eight findings, and where each fix landed.

- 1** **PR 1274 · PR 1273**
a mid-turn prompt is lost without queue: true, and a killed session still answers 200 so resume reports success doing nothing
- 2** **PR 1279 · PR 1278 · PR 1286**
sandbox liveness unreported; orphaned boxes never reaped; a failed reconnect leaves the box running and billing
- 3** **PR 1281 · PR 1277**
app serve ignores the declared UI path; a mutating proxy route had no auth gate
- 4** **FIXED IN THE ROOM**
the fan-out cursor froze on resume, the artifact link outlived its box, and a recap fix shipped dead on arrival — each now has a regression test

Day one rule: never fork, never vendor, never patch the runtime. Eight findings later it held — seven pull requests open upstream, each with a test that reproduces the failure first.

On a real phone, in the rehearsal log.

- Cold boot to a working room with a shared artifact: 86.5 seconds.
- Two members on two surfaces, every message attributed, one reply reaching both.
- The agent edits the shared artifact on request, confirmed live on its URL.
- A PDF previewed, confirmed by a member, byte-matched in the inbox.
- The sandbox deleted out from under the room — the next message revived it.
