

AI is already in your pocket.

It is just only ever in one pocket at a time.

TODAY

Your AI and your colleague's have never met.

- Two people, two phones, two assistants that never talk.
- You screenshot one and paste it into the other.
- You are the middleman. Nothing you agreed reaches either of them.

ILLUSTRATION

Two phones side by side, each with its own AI chat, a screenshot travelling from one to the other. Buildable without a shoot.

Put everyone's pocket in the same room.

- One conversation, shared across everybody's phone.
- In the messaging app they already have open.
- An agent in the middle, sorting out who wants what.

ILLUSTRATION

The money shot. The 4-up frame mid-conflict: Julie's phone, Tom's phone, the room view carrying the agent's "Tom's villa is 16k, Julie's cap is 12k", and the document.

GETTING IN

Text a bot. You are in.

- No app to download. No account to create. No login to share.
- Send someone the code and their phone is in the room too.
- An agent joins exactly the way a person does.

ILLUSTRATION

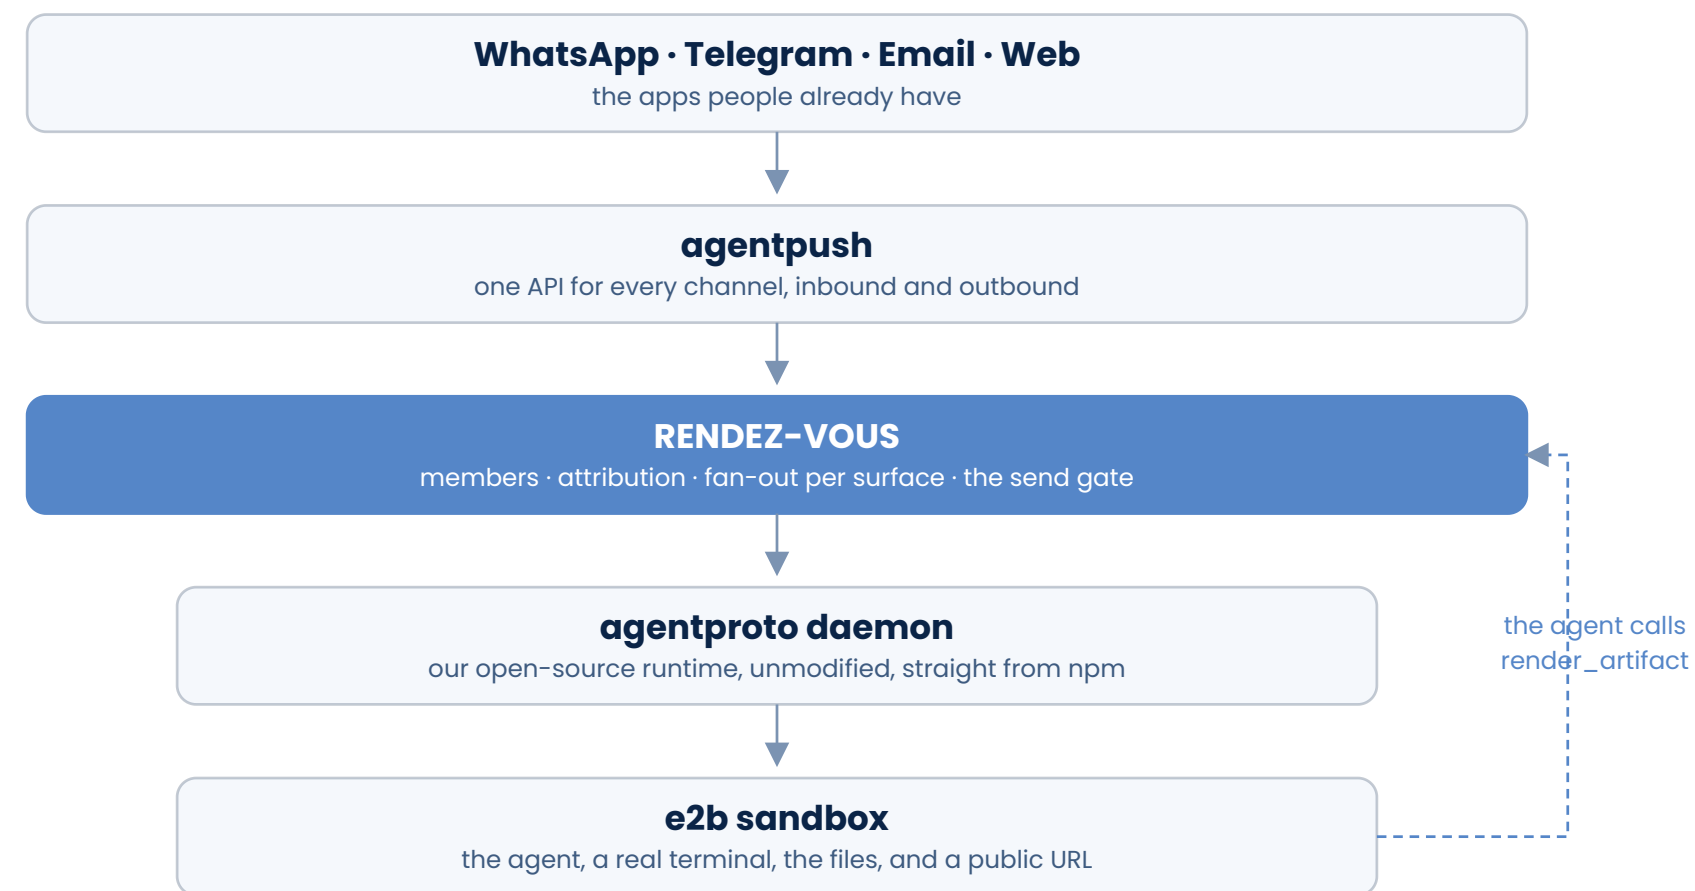

One phone texting "new", the room code and QR coming straight back. A second phone joins. Two real screens.

One orchestrator. N humans. N agents.

Only the orchestrator sees every thread. That is how it can tell you your budget does not fit what someone else just asked for.

What it runs on.

The sandbox is the boundary. It is nobody's laptop, and no member's credentials ever go inside it. The room reaches the agent through the daemon. The agent reaches back out through one tool, and only that one.

A shared sandbox your whole team can text into.

Safe, multiplayer, and open from the messenger you already use.

On a real phone, not a mock.

- Texted "new" from a phone. A working room with a shared document, 86 seconds later.
- Two people, two surfaces. Every message attributed. One answer reaching both.
- Voice notes and photos in. A voice note, a PDF and a live website back out.
- A private answer to one member. The others see that it happened, not what it said.
- We deleted the machine out from under the room. The next message brought it back.
