

Work is multiplayer.

Agents are single-player.

TODAY

You spend your day copy-pasting between two chats.

- One thread per person. One chat per AI.
- You carry the context between them, by hand.
- Nobody else ever sees it.

ILLUSTRATION

Two chat windows side by side, the same message being dragged from one to the other.
Build this one — no shoot needed.

Everyone works in one room — people and agents.

- Several people. Several agents. One conversation.
- Each on the app they already use.
- An agent in the middle, sorting out who wants what.

ILLUSTRATION

THE money shot. The 4-up frame mid-conflict: Julie's phone, Tom's phone, the room view showing the agent's "Tom's villa is 16k, Julie's cap is 12k", and the artifact.

GETTING IN

You join by texting a bot.

- Nothing to install. No account to share.
- Phone, browser, or just reply to the email.
- An agent joins the same way a person does.

ILLUSTRATION

One phone: “new” → the room code and QR come straight back. A second phone joins. Two real screens.

One orchestrator. N humans. N agents.

Only the orchestrator sees every thread — which is how it can tell you that what you just asked for contradicts what someone else asked for.

What it runs on.

The sandbox is the isolation boundary: nobody's laptop, and no member's credentials inside it. The room reaches the agent through the daemon; the agent reaches back out through one MCP tool, and only that one.

You are not the middleman anymore.

Humans and agents, finally in the same room.

What each fix targeted:

- 1** **PR 1274 · PR 1273**
a mid-turn prompt is lost without queue: true,
and a killed session still answers 200 so resume
reports success doing nothing
- 2** **PR 1279 · PR 1278 · PR 1286**
sandbox liveness unreported; orphaned boxes
never reaped; a failed reconnect leaves the box
running and billing
- 3** **PR 1281 · PR 1277**
app serve ignores the declared UI path; a
mutating proxy route had no auth gate
- 4** **FIXED IN THE ROOM**
the fan-out cursor froze on resume, the artifact
link outlived its box, and a recap fix shipped dead
on arrival — each now has a regression test

On a real phone, in the rehearsal log.

- Cold boot to a working room with a shared artifact: 86.5 seconds.
- Two members on two surfaces, every message attributed, one reply reaching both.
- The agent edits the shared artifact on request, confirmed live on its URL.
- A PDF previewed, confirmed by a member, byte-matched in the inbox.
- The sandbox deleted out from under the room — the next message revived it.
